

Automated Intelligence underpins UK Government Department's landmark digital transformation

Government Department to become data-driven with Automated Intelligence's AI.DATALIFT.

Customer Situation

With hundreds of terabytes of information across legacy systems, this Government Department is one of the most data-rich in the UK.

It wanted to analyse and streamline its data and transition to a next-generation Cloud strategy, in line with the UK Government's policy and vision for technology change and excellence.

By analysing its data, the Department is able to use it more effectively, better serving internal and external customers and driving future strategy. Improved data quality and accessibility supports the introduction of Microsoft Office 365, and Microsoft Azure enables staff collaboration across the organisation.

The Solution: AI.DATALIFT

AI.DATALIFT analyses the data held across disparate repositories, sorting according to value and DROT (duplicate, redundant, obsolete or trivial) and stores, deletes or archives it, as appropriate.

250tb of the Department's unstructured data is remediated and transitioned to Office 365 and Azure, utilising the Microsoft Office licenses which it had already procured.

Automated Intelligence can analyse and remediate unstructured data up to **30 times** faster than traditional on-premise vendors

Customer Benefits

The Department gains from:

- > Informed decision making
- > Improved data management
- > Reduced information risk
- > Enhanced data security
- > Increased user productivity and collaboration
- > ICT cost savings
