

Automated Intelligence (AI) migrates statistics producer from Lotus Notes to Office 365.

UK statistics body selects Automated Intelligence for major IT transformation project

Customer Situation

As part of a major technology refresh, the organisation selected AI to help deliver a strategic migration program from their legacy Lotus Notes databases to Microsoft Office 365.

The body used Lotus Notes extensively across the business and held millions of documents within the platform.

It wanted to maximise the investment it had already made in Microsoft Office 365, while also enhancing capabilities for electronic records management and user collaboration.

As this was a major business transformation project, user adoption was vital to its success.

AI.DATAPPOINT supports digital transformation by analysing and migrating data from over 40 sources.

The Solution: AI.DATAPOINT

Automated Intelligence delivered a successful migration of content from Lotus Notes to Office 365's SharePoint, along with existing metadata, security and policies, using its AI.DATAPOINT migration tool. In addition AI provided business application transformation for the many Lotus Notes applications through its services division.

This involved extracting documents from Lotus Notes in their native format and transforming them to Microsoft Word ready for migration into SharePoint.

Data was analysed to determine what was business critical and what was DROT (duplicate, redundant, obsolete and trivial content) and if it could be deleted.

Valuable data was migrated to SharePoint or archived in Azure, ensuring continuity of access to the current and historical data at all times.

Automated Intelligence further extended Office 365's functionality to accelerate adoption, increase productivity and meet Records Management requirements. This was achieved with AI's SharePoint-Outlook integration and compliance toolset, AI.SYNCPOINT+.

Customer Benefits

- > Office 365 employed as the primary collaboration and records management system.
- > Fulfilled the necessary and rigorous governance capabilities required
- > Attained high levels of user demand and adoption
- > Improved management, access and usability of the knowledge that is owned by the organisation.
